

US Labor Market Overview

March 2024

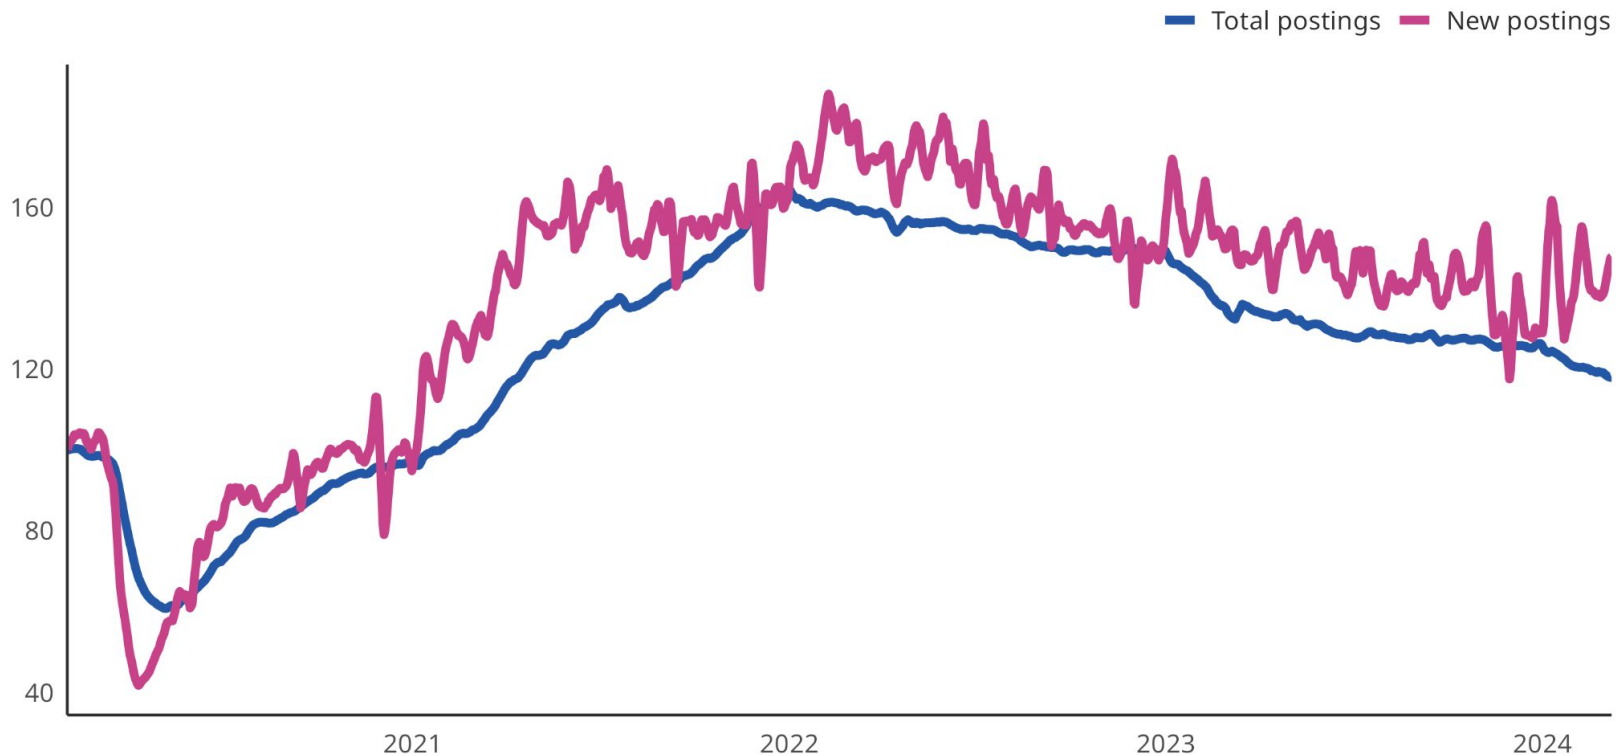

US Labor Market Overview

March 2024

- The resilient US labor market continues to steadily moderate as demand levels off and wages slow down. If the recent slowdown in labor force growth continues, a further cooldown could be more painful.
- Demand for new hires has cooled, but job postings remain above their pre-pandemic level, and job openings outnumber unemployed workers.
- The quits rate is now below pre-pandemic levels and layoffs remain low, suggesting employers are having an easier time retaining current employees
- Growth in labor supply has stalled recently as prime-age workers' employment and labor force participation rates have held flat in recent months.
- Wages are slowing down, with posted wages set to grow at rates consistent with 2% inflation in the next few months. At the same time, wages are still growing faster than prices, leading to inflation-adjusted wage gains for many workers.

US job postings have continued to moderate

Index, 100 = Feb 1, 2020, United States, data through Mar 8, 2024
